## HW - Chapter 7 - Capital Budgeting- Q2

Net Present Value (NPV) of Projects

| Year | Cash Inflows of Project A | Cash Inflows of Project B | Present Value <br> Factor @ 10\% | PV of Project A | PV of Project B |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 50,000 | 1,40,000 | 0.909 | 45,450 | 1,27,260 |
| 2 | 60,000 | 1,90,000 | 0.826 | 49,560 | 1,56,940 |
| 3 | 40,000 | 1,00,000 | 0.751 | 30,040 | 75,100 |
| PV of Inflows |  |  |  | 1,25,050 | 3,59,300 |
| (-) PV of outflows |  |  |  | $(1,00,000)$ | $(3,00,000)$ |
| NPV |  |  |  | 25,050 | 59,300 |

## Internal Rate of Returns (IRR) of projects

Since by discounting cash flows at 10\%, we are getting values very far from PV of outflows, hence, let us discount cash flows using $20 \%$ and $25 \%$ discounting rate.

## Project A

| Year | Cash Inflows | DF @ 20\% | PV | DF @ 25\% | PV |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 50,000 | 0.833 | 41,650 | 0.800 | 40,000 |
| 2 | 60,000 | 0.694 | 41,640 | 0.640 | 38,400 |
| 3 | 40,000 | 0.579 | 23,160 | 0.512 | 20,480 |
| PV of Inflows |  |  |  | $1,06,450$ |  |
| 98,880 |  |  |  |  |  |

The internal rate of return is, thus, more than $20 \%$ but less than $25 \%$. The exact rate can be obtained by interpolation:
IRR of project $A=20+6,450 \div 7,570 \times 5=24.26 \%$ per annum
Project B

| Year | Cash Inflows | DF @ 20\% | PV | DF @ 25\% | PV |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | $1,40,000$ | 0.833 | $1,16,620$ | 0.800 | $1,12,000$ |
| 2 | $1,90,000$ | 0.694 | $1,31,860$ | 0.640 | $1,21,600$ |
| 3 | $1,00,000$ | 0.579 | 57,900 | 0.512 | 51,200 |
| PV of Inflows |  |  |  | $3,06,380$ |  |
| 284,800 |  |  |  |  |  |

IRR of project $B=20+7,570 \div 21580 \times 5=21.48 \%$ per annum

|  | Project A | Project B |
| :--- | :---: | :---: |
| NPV @ 10\% | Rs. 25,050 | Rs. 59,300 |
| IRR | $24.26 \%$ | $21.48 \%$ |

Thus, there is a contradiction in ranking by two methods.
